

Abstract

For a liquid-, or gas-, sensor composed of a sensor module SM and a sensor module head SMK, which are pluggably connectable together and which enable when plugged together an exchange of data and energy via a galvanically decoupled, transfer zone, a pluggable module ST1, or ST2, as the case may be, is provided, which is connectable with the sensor module SM, or with the sensor module head SMK, and which serves for display of sensor data stored in the sensor module SM, or for simulation of a measured value.
